# Continuous Distribution

A continuous probability distribution is a probability distribution whose support is an uncountable set, such as an interval in the real line. There are many examples of continuous probability distributions: normal, uniform, chi-squared and others.

In [1]:
```
from IPython.display import Math, Latex
from IPython.core.display import Image
import matplotlib.pyplot as plt
import numpy as np
import seaborn as sns
```

In [2]:
```
%matplotlib inline
sns.set(color_codes = True)
sns.set(rc = {'figure.figsize':(5, 5)})
```

# Uniform Distribution

In probability theory and statistics, the continuous uniform distribution or rectangular distribution is a family of symmetric probability distributions. The distribution describes an experiment where there is an arbitrary outcome that lies between parameters a and b, indicating the lower and upper bound values. The interval can either be open i.e. (a, b) or closed i.e. [a, b]

In [4]:
```
from scipy.stats import uniform
n = 10000
start = 10
width = 20
data_uniform = uniform.rvs(size = n, loc = start, scale = width)

ax = sns.displot(data_uniform, bins = 100, kde = True, color = "yellow", linewidth = 15, alpha = 1)
ax.set(xlabel = "Uniform Continuous Dist.", ylabel = "Frequency")
```

```

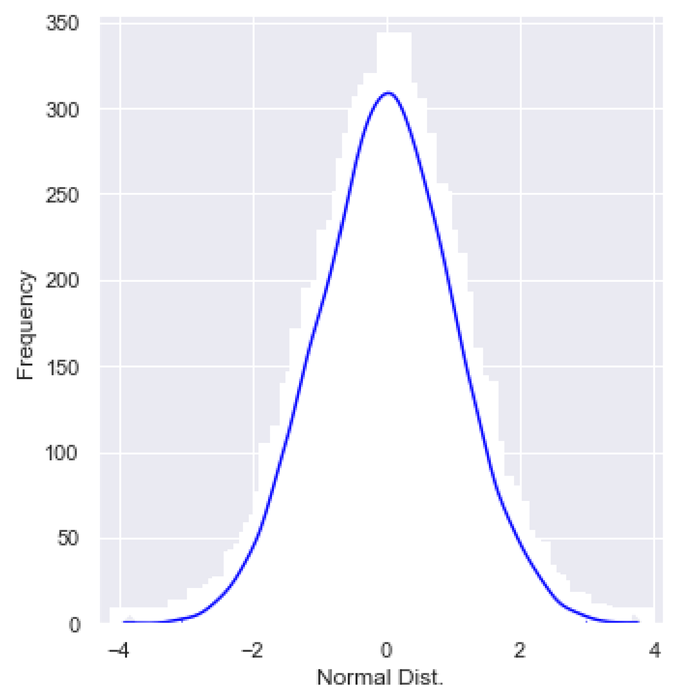
# Normal Distribution

In probability theory, a normal (or Gaussian or Gauss or Laplace-Gauss) distribution is a type of continuous probability distribution for a real valued random variable.

In [5]:
```
from scipy.stats import norm
data_norm = norm.rvs(size = 10000, loc = 0, scale = 1)
ax = sns.displot(data_norm, bins = 100, kde = True, color = "blue", linewidth = 15, alpha = 1)
ax.set(xlabel = "Normal Dist.", ylabel = "Frequency")
```

Out[5]:
```
<seaborn.axisgrid.FacetGrid at 0x3cdc530>
```

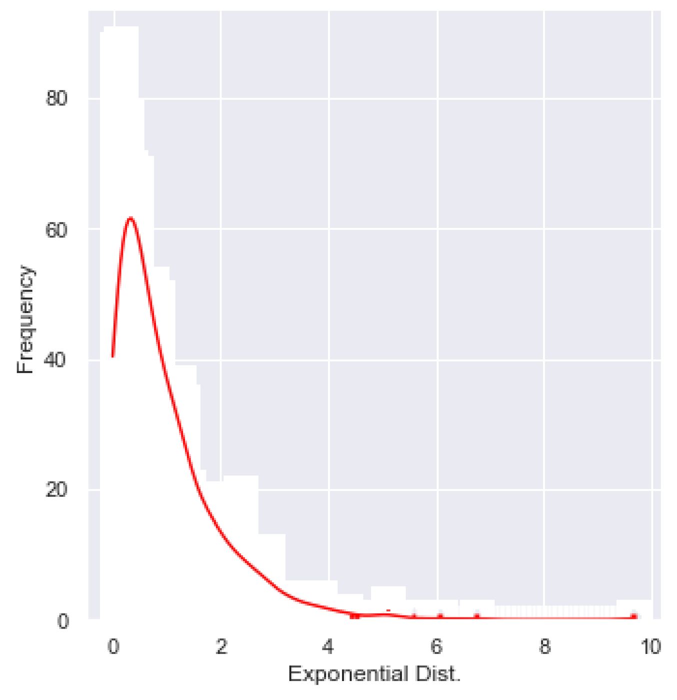


# Exponential Distribution

In probability theory and statistics, the exponential distribution is the probability distribution of the time between events in a Poisson point process, i.e., a process in which events occur continuously and independently at a constant average rate. It is a particular case of the gamma distribution

In [6]:
```
from scipy.stats import expon
data_expon = expon.rvs(scale = 1, loc = 0, size = 1000)
ax = sns.displot(data_expon, bins = 100, kde = True, color = "red", linewidth = 15, alpha = 1)
ax.set(xlabel = "Exponential Dist.", ylabel = "Frequency")
```

Out[6]:
```
<seaborn.axisgrid.FacetGrid at 0x5e863f0>
```

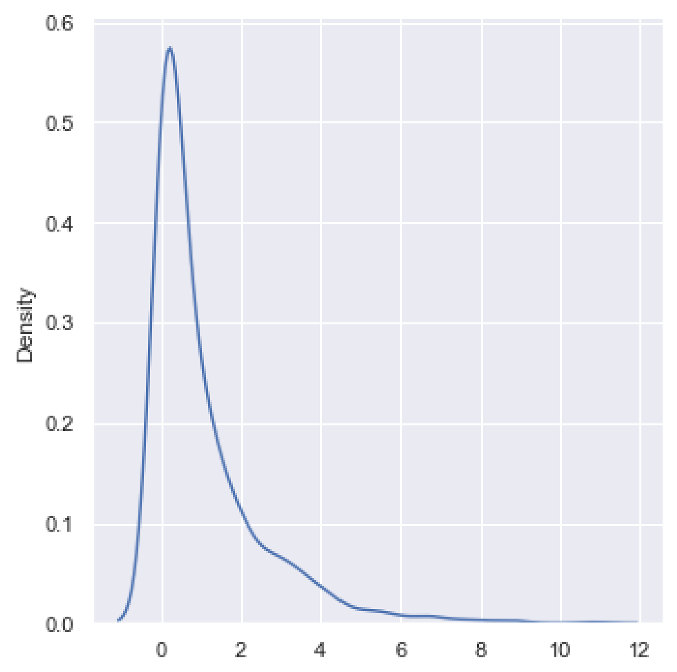


# Chi-Squared distribution

In probability theory and statistics, the chi-squared distribution (also chi-square or χ2-distribution) with k degrees of freedom is the distribution of a sum of the squares of k independent standard normal random variables. The chi-squared distribution is a special case of the gamma distribution and is one of the most widely used probability distributions in inferential statistics, notably in hypothesis testing and in construction of confidence intervals

In [7]:
```
from numpy import random
x = random.chisquare(2, size = (2, 3))
print(x)
sns.displot(random.chisquare(df = 1, size = 1000), kind = "kde")
plt.show()
```

```
[[0.75659443 7.98279964 1.79475664]
 [0.44983346 2.5256031  0.14190418]]
```



# Weibull Distribution

In probability theory and statistics, the Weibull distribution is a continuous probability distribution. It is named after Swedish mathematician Waloddi Weibull, who described it in detail in 1951

In [8]:
```
a = 5
s = random.weibull(5, 10)
x = np.arange(1, 100) / 50
print(x)
def weib(x, n, a):
    return (a / n) * (x / n) ** (a - 1) * np.exp(- (x / n) ** a)
count, bins, ignored = plt.hist(np.random.weibull(5, 1000))
x = np.arange(1, 100) / 50
scale = count.max() / weib(x, 1, 5).max()
plt.plot(x, weib(x, 1, 5) * scale)
plt.show()
```
